SUMMARY

Second-year Bachelor of Computing student at ANU (machine learning) who ships AI and data projects end to end and has delivered for a real external client in an agile team. Turns ambiguous problems into working software and explains technical ideas in plain language to technical and business audiences.

EDUCATION

Australian National University

Canberra, ACT

Bachelor of Computing (Machine Learning)

2025 – 2028

- Relevant coursework: data structures and algorithms, computing systems, machine learning, software construction.

EXPERIENCE

Industry Project Intern

2025

Practera — Experience Program (Remote)

- Advised an external events company on market strategy as part of a cross-functional consulting team, delivering research-backed recommendations across several agile sprints with weekly client check-ins.
- Researched and analysed multiple market areas to surface actionable insights, helping the client understand market conditions and size the opportunity to inform their decisions.
- Presented findings and trade-offs in plain language to non-technical stakeholders, translating analysis into clear, business-focused recommendations.

PROJECTS

AI Government Grant Form Assistant | *Group project · Python, LLM APIs*

2025 – Present

- Built an end-to-end tool with a team that auto-fills government grant application forms from user inputs, taking it from concept to a working pipeline.
- Integrated LLM APIs to interpret form fields and generate accurate, context-aware responses grounded in user data, cutting manual paperwork.

LLM Chatbot with RAG | *Solo project · Python, OpenAI & Claude APIs, Ollama*

2025

- Built a multi-turn chatbot with custom system prompts and conversational memory on the OpenAI and Claude (Anthropic) APIs.
- Added a Retrieval-Augmented Generation pipeline so it answers from custom knowledge sources instead of guessing.
- Benchmarked local models via Ollama against cloud APIs to weigh performance versus cost, applying a practical eye on solution trade-offs.

Relational Database Engine (AURA SQL) | *Group project · Go, SQL*

2026 – Present

- Building a relational database engine from scratch in a 3-person team, owning the storage layer and a transaction system with MVCC for safe concurrent reads and writes.
- Coordinating clean interfaces with teammates building the SQL front-end (parser and planner) and the execution engine with B-tree indexing.

AI Traffic Violation Detection | *Personal project · Python, Computer Vision*

In progress — Jul 2026

- Building a computer-vision tool that analyses road imagery to detect and classify rule-breaking, automating what would otherwise be manual review.

Smart Animal Monitoring System | *Group project · Python, AI image recognition*

2025

- Built an AI image-recognition model that detects and classifies wildlife from camera images, forming the software core of a proposed farmland crop-protection concept.
- Designed how the detection software would drive real-time farmer alerts within the wider system, collaborating across the team on the end-to-end concept.

TECHNICAL SKILLS

AI / ML: LLM chatbots & agents, RAG pipelines, prompt engineering, NLP, computer vision, scikit-learn

Cloud & APIs: Claude API (Anthropic), OpenAI API (GPT-4), REST APIs, Ollama (local models)

Languages: Python (primary), Java, Go, SQL, C, Haskell

Data: NumPy, pandas, SQL, data preprocessing & evaluation

Ways of working: Git, agile sprints, demos & prototyping, technical communication, VS Code
